

ENERGY EFFICIENCY POLICY

At [Rammos Managed by Dedeman](#), we recognize the importance of ensuring the sustainability of natural resources and preserving clean energy alternatives for future generations. Guided by a responsible and forward-thinking approach, we continuously seek solutions that allow us to balance the energy we consume by implementing sustainable practices and contributing to a more energy-efficient future.

In line with our environmental responsibilities and legal obligations, we closely follow national and international standards, laws, and regulations related to energy management. We voluntarily carry out initiatives aimed at reducing energy consumption and continuously improving our energy performance while carefully monitoring the outcomes of these efforts.

For this purpose, we are committed to the following principles:

1. We establish measurable energy efficiency goals and include energy awareness and efficiency practices within our employee training programs to ensure active participation from all team members.
2. We value cooperation with all our stakeholders in creating shared goals and positive outcomes regarding energy management. We actively promote awareness and encourage collaboration with our guests, employees, visitors, suppliers, and business partners to collectively build a strong culture of energy responsibility.
3. We continuously research, evaluate, purchase, and implement energy-efficient products, equipment, technologies, and operational alternatives that contribute to reducing overall energy consumption.
4. We aim to document our Energy Management System, implement it across all departments, regularly review and update it when necessary, and continuously improve its effectiveness throughout the organization.
5. As part of our digital transformation initiatives, we carry out projects designed to improve operational efficiency and optimize processes through digitalization.
6. In accordance with industry requirements, we develop operational plans and procedures focused on maximizing energy savings wherever possible throughout our business processes.
7. We continuously evaluate potential energy-related risks and emergency situations, including energy shortages or operational constraints, while identifying preventive actions and improvement opportunities.
8. We plan and allocate the necessary information resources, human resources, and financial investments required for effective energy management, always aiming to achieve the highest level of efficiency and sustainable benefit.

Through these commitments, we strive to build a culture of responsible energy consumption, reduce environmental impact, and contribute to a more sustainable future for generations to come.
